

StudyPilot AI

Problem Statement

Background

Students often struggle to organize their studies effectively because every learner has different subjects, strengths, weaknesses, available study hours, and examination schedules. Generic timetables do not address individual learning needs, resulting in poor time management, inconsistent revision, last-minute preparation, and increased examination stress.

Problem

There is a need for an intelligent study planning system that automatically generates personalized study schedules, revision plans, daily learning tasks, and motivational guidance based on each student's academic profile.

Proposed Solution

StudyPilot AI is an AI-powered personalized study planner developed using Python and Streamlit with an Agentic AI architecture. The system includes a Study Planner Agent, Revision Agent, Analytics Agent, and Motivation Agent that work together to generate customized study plans, prioritize weak subjects, create revision strategies, monitor progress, and motivate students.

IBM Cloud & AI Readiness

The project follows an IBM Granite-ready architecture. It currently uses a local MockGraniteAgent for offline execution while remaining prepared for future IBM watsonx.ai Granite integration through a modular AI engine.

Expected Outcome

StudyPilot AI improves time management, encourages consistent learning, reduces examination stress, and helps students achieve better academic performance through personalized AI-assisted planning.

Objectives

- Generate personalized study plans.
- Create effective revision schedules.
- Prioritize weak subjects using analytics.
- Provide motivational guidance.
- Support offline AI functionality.
- Enable future IBM watsonx.ai integration.
